Covalent Ceramics III: Volume 410 Aloysius F. Hepp, 1996-08-14 In years prior, there has been considerable research activity in an exciting class of materials - non-oxide covalent ceramics. These nitrides, carbides, sulfides and related materials have found a wide range of use, from electronics to aerospace/defense, optical sensors and devices, and mechanical/structural applications. In this book, the third in a continuing series, chemists, physicists, ceramists and materials scientists and engineers from around the world come together to share research and highlight recent advances in non-oxide materials. In contrast to its predecessors, the focus of the volume is less on production and fabrication, and more on applications and properties. Topics include: non-oxides for electronics and optoelectronics; preparation of bulk non-oxide ceramics; science of covalent ceramics - bonding, structure and microstructure; fabrication of covalent ceramic thin films; and technology of covalent ceramics - surfaces, composites and processing.

**Formation of Silicon Nitride from the 19th to the 21st Century** Raymond C. Sangster, 2005 This comprehensive reference gathers information published on the chemistry of silicon nitride and its products, uses, and markets. Separate chapters overview the manufacture of silicon nitride powder, the production of silicon nitride ceramics via the reaction bonding process, the intrinsic reactions between crystalline silicon surfaces and N<sub>2</sub> for silicon wafers, nitridation of Si-O based materials, and chemical vapor deposition of Si-H compounds. The author, who originally worked on a similar book for the Gmelin Institute, cites 4,000-plus source documents and points the researcher to relevant handbooks, papers, and review articles for further reading. Highly Anisotropic Crystals E.I. Givargizov, 1987 Anisotropy, i.e., the dependence of structure and properties on direction in space, is the most striking characteristic of crystals. Anisotropy is a result of the discrete nature of the crystal lattice, and it is the characteristic which distinguishes the crystalline state from another solid state of matter, the amorphous. The anisotropy of the structure and properties of crystals (this can be called their 'internal anisotropy') is also reflected in their external structure, i.e., morphology. The reflection is, however, non-linear: properties such as mechanical hardness ... do not change strongly (typically several tens of percents, depending on direction) while the morphology ... : the linear sizes in different directions of individual crystals often differ by several multiples or even several orders of magnitude, depending on

the symmetry of the crystalline lattice and/or of the crystal prehistory. The enhanced anisotropy of morphology is, as a rule, a result of growth kinetics of different crystalline faces; it reflects a non-linear character of the kinetic laws of growth. This book is devoted to high morphological anisotropy. No strict classification of highly-anisotropic crystals exists. However some typical forms, or habits, can be singled out: first, whiskers (or needles, or fibers) as quasi-one-dimensional crystals, and second, platelets as quasi-two-dimensional crystals.
