**Dimensionner les ouvrages en maçonnerie** Marc Pelcé, Nicolas Juraszek, Marcel Hurez, 2014-10-02 Préface de Didier Brosse - Président de l'Union de la maçonnerie et du gros-oeuvre (Fédération française du bâtiment) Reposant sur le modèle semi-probabiliste, l'Eurocode 6 a modifié les règles françaises de conception des maçonneries : comme dans les autres Eurocodes, on y distingue l'analyse des sollicitations de l'analyse des résistances et la méthode de calcul prend notamment en compte le cycle de vie du bâtiment. Tout en faisant référence - quand il le faut - au DTU 20.1, cette nouvelle édition du guide d'application s'appuie donc sur la toute dernière version de l'Eurocode 6 (mars 2013), sur les quatre annexes nationales françaises (publiées entre 2007 et 2012) et sur l'Eurocode 8 (Calcul des structures pour leur résistance aux séismes). Les auteurs y décrivent les propriétés et les caractéristiques des ouvrages en maçonnerie, l'analyse structurale, le dimensionnement aux états limites ultimes, aux états limites de service et contient un chapitre d'exemples pratiques (mur chargé au vent, mur de contreventement, mur de soubassement, linteau en maçonnerie, murs de maçonnerie sous sollicitations sismiques, mur intérieur non porteur-cloison). On y trouvera, en clair, les spécifications de l'Eurocode 6 sur la façon de concevoir, calculer et mettre en oeuvre une maçonnerie réalisée avec des briques, des blocs de béton ou de béton cellulaire, ou des pierres. On peut aussi l'utiliser pour ses exercices d'application. Six cas classiques sont détaillés pour guider le concepteur. On pourra par ailleurs librement télécharger à l'adresse du livre sur [www.editions-eyrolles.com](http://www.editions-eyrolles.com) les feuilles de calculs correspondant aux exercices.

**Cutoffs for Dams** CIGB ICOLD, 2018-12-07 ICOLD Bulletin 150, Cutoffs for Dams, discusses foundation treatment methods using cutoff-type barriers. High emphasis is given to alluvial deposits throughout this document; however, different materials may require cutoff. The construction of cutoffs has made significant advances mainly through the development of more powerful machinery for drilling and excavation, but also through the introduction of new concepts and techniques, such as jet grouting and deep soil mixing. The following types of cutoffs are presented in this Bulletin: - Diaphragm walls - Vib walls - Pile walls - Superimposed concreted galleries - Jet grouting - Deep mixing These methods are described, and the practical application of each method is illustrated by selected case histories. These case histories also demonstrate how certain difficulties specific to a particular dam site have been dealt with. The performance of cutoffs should be monitored so that their efficiency in reducing flow and piezometric head can be evaluated. Piezometers installed in the foundation

upstream and downstream of the cutoff are needed to meet this objective.
